

What's New: **OL[®] Connect** Send v1.8

The highlights

- Interactive user experience
- Memory efficient
- Smart user license check

OL Connect[®] Send on Citrix and Microsoft Remote Desktop Services

Support for multi-user environments is here

Citrix and Microsoft Remote Desktop Services (RDS) are both environments that allow many users, up to hundreds, to work on a server. With this release OL Connect Send supports these multi-user environments.

Interactive user experience

Multiple users connecting to the same system can now print via OL Connect Send with the interactive browser window popping up appropriately.

Memory efficient

When operating in multi-user environments, applications need to run efficiently. In line with this, the OL Connect Send client can now be configured to use memory only when a user is actually printing.

Smart user license check

In multi-user environments it is critical that all users connecting simultaneously to the same server be properly counted. This release introduces a new way of checking user-based licenses.

Instead of only checking the machine ID, the username is now also verified to determine if the user limit has been reached and more seats are required.
